

A New Electromagnetic Exposure Metric:

High Frequency Voltage Transients Associated With Increased Cancer Incidence in Teachers in a California School

by Samuel Milham, MD, MPH, and L. Lloyd Morgan, BSc -as published in the American Journal of Industrial Medicine (2008)

The researchers did a retrospective study of the cancers at a school where teachers felt they had an unusually high incidence of cancer and authorities were denying the existence of a cluster. Their conclusions were "The cancer incidence in the teachers at this school is unusually high and is strongly associated with high frequency voltage transients, which may be a universal carcinogen, similar to ionizing radiation." This is a very strong statement. Not only should further studies be done, but existing regulations to keep power clean should be strictly and immediately enforced. New regulations limiting the pollution level each electronic device is allowed to put out should be put in place. Currently such regulations are designed to prevent radio interference. They should be designed to protect human health.

Other research on the health effects of electrical pollution can be found on the Research Page. (<http://www.electricalpollution.com/Research.html>) Health benefits of lowering electrical pollution levels include improved blood sugar control, significant improvement in MS symptoms, and improvement in a whole host of other symptoms.
